

Input: data & initial visualization

Propose
model(s)

```
rbf_a = pm.HalfNormal(  
warped_a = pm.HalfNormal(  
    'warped_a', sigma=5.0)  
[...])
```

Models defined in PyMC

Signal has decaying
amplitude, best
model uses a warped
periodic kernel with
AIC of -435.31.

Model fit without visual tools

Retrieve / create tool (contribution of this work)

The warped kernel does
not sufficiently cover the
initial portion of the signal.
Compute residuals to
determine how to adjust
model.

**Diagnostic
residuals**

Select best model,
summarize results

Evaluate

Model fit **with** visual tools
